

2008 Reliability Conference

MONCTON, NB, October 2, 2008

The 2008 Reliability Conference was a great success with roughly 40 people in attendance. There was a diverse range of industry represented in Moncton. Maximum RPM used a new approach to the traditional presentation style conference. The round table style produced open conversations between those in the industry, guided by the needs outlined at the beginning of the conference. This interaction delivered a great deal of insight to the state of our industries and their requirements.

Maximum RPM had representatives on hand from DMSI, Trico, and Vibro-meter as well as our staff to guide the conference and act as industry experts. In addition to the interactive format these industry experts each gave a small presentation geared toward the audience's requests. The conference ended with an interactive demonstration of the DMSI MAINTelligence software including a new version which will be available soon.

Maximum RPM would like to thank all those who attended and participated in the reliability conference and contributed to the success of the event.

About Maximum RPM

Maximum RPM is an Industrial Operations consultancy that offers guidance and solutions to clients seeking to reduce their operating costs while increasing productivity. The company is committed to the development, application, management and support of reliability solutions. Maximum RPM has extensive experience successfully applying industrial know-how and effective strategies to a wide range of customers in the oil & gas, pulp & paper, marine, mining, power and manufacturing industries. The company's expertise lies in consulting, implementing and training centered on reliability and condition monitoring programs to ensure the diagnosing of machinery asset issues prior to production, safety or environmental losses.
